

# Campus Crisis Agent

## Technical and Submission Guide

### STUDENT-FACING

#### Input CSV

Each row contains: report\_id, timestamp, location, category, reported\_severity, description, reporter\_type.

Treat all fields except report\_id as potentially missing or inconsistent. Process reports in file order. Do not reorder by timestamp because an unseen timestamp may be malformed.

#### Required JSONL prediction

Write exactly one JSON object per processed report:

```
{
  "report_id": "R104",
  "incident_id": "I003",
  "relationship": "CORROBORATION",
  "severity": "CRITICAL",
  "confidence": 0.92,
  "actions": [{"type": "CONTINUE_RESPONSE", "service_id": "SVC-FIRE"}],
  "incident_status": "ESCALATED",
  "human_review": false
}
```

Required values:

- relationship: NEW, UPDATE, CORROBORATION, CONFLICT, DUPLICATE or RESOLUTION.
- severity: LOW, MEDIUM, HIGH or CRITICAL.
- confidence: number from 0 to 1.
- incident\_status: INVESTIGATING, ACTIVE, ESCALATED, CONTROLLED or RESOLVED.
- human\_review: Boolean.
- actions: an array; [ ] is valid and means no new action.

Recommended action types: DISPATCH, NOTIFY, REQUEST\_INSPECTION, REQUEST\_VERIFICATION, ESCALATE\_RESPONSE, CONTINUE\_RESPONSE, CREATE\_TICKET, MONITOR, CLOSE\_INCIDENT, NO\_NEW\_ACTION.

CONTINUE\_RESPONSE means an existing response remains appropriate. It should not represent another dispatch.

#### Dashboard acceptance checklist

- Current input report is visible.
- Every processed report appears in a decision log.
- Clicking an incident reveals its reports and current assessment.
- Action history distinguishes new actions from continued actions.
- Conflicting evidence and confidence changes can be found quickly.
- The dashboard can replay reports in supplied order.

#### Submission structure

```
team-name/  
  README.md  
  architecture.md  
  source/  
  prompts/          # if used  
  package or dependency files  
  run_predictions.*  
  team_declaration.md
```

The README must state one exact command for setup, one for running the dashboard and one for generating predictions. Do not include secrets. Provide required environment-variable names separately.

## Freeze checklist

- Run the system from a clean start.
- Confirm output is valid JSONL with one line per report.
- Confirm report IDs match the input.
- Confirm the dashboard displays the same decisions as the JSONL output.
- Remove API keys and personal data.
- Submit before the announced freeze time.
